Dear Hiring Manager,

I am interested in working more with development and IT. I currently work as an IT consultant at Helse Vest IKT and I am studying frontend development. I would like to gain more experience with development and continue learning.

Through my studies, I have worked with HTML, CSS and JavaScript and created different websites and projects. I have worked with responsive design, APIs and improving the design and functionality of websites. I have also used Git, GitHub, VS Code and Figma.

I have worked both independently and as part of a team on different projects. I have also learned about project methodology and used Kanban to plan and organise my work. I like working on projects where I can see the result of what I am building, and I enjoy finding problems and figuring out how to solve them.

In my current job, I work with user support and troubleshooting. I help users, solve different problems and work with different systems. I think this experience is also useful in development, especially when it comes to problem solving and understanding the needs of users.

I am also studying backend development and have worked with Python. I am currently learning SQL. I enjoy learning new things and would like to continue developing my skills and get more experience with development, applications and systems.

I would be happy to tell you more about my experience and learn more about possible opportunities. Thank you for reading my application.

Kind regards,
Kim T Henriksen
